**Abstract** – Aim of this paper is to introduce a new type of connected space namely  $\alpha$ ws-connected space. Also we obtain some properties of  $\alpha$ ws-connected space.

**AMS Classification 2010:** 54D05

**Key words:**  $\alpha$ ws-connected space,  $T_{\alpha$ ws-space.

### 1. INTRODUCTION

In topology and related branches of mathematics a connected space is a topological space that cannot be represented as the union of two disjoint non empty open subsets. Connectedness is one of the principal topological properties that are used to distinguish topological spaces. In this paper we introduce  $\alpha$ ws-connected space.

### 2. PRELIMINARIES

Throughout this paper  $(X, \tau)$ ,  $(Y, \sigma)$  and  $(Z, \mu)$  represents the topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset  $A$  of a topological space  $(X, \tau)$ ,  $clA$  and  $intA$  denote the closure of  $A$  and the interior of  $A$  respectively.  $X - A$  denotes the complement of  $A$  in  $X$ . We recall the following definitions

**Definition 2.1:** A subset  $A$  of a space  $X$  is called

- (i)  $\alpha$ -open [9] if  $A \subseteq int\ cl\ intA$  and  $\alpha$ -closed if  $cl\ intclA \subseteq A$ .
- (ii) regular open [10] if  $A = intclA$  and regular closed if  $cl\ intA = A$ .

- (iii)  $\pi$ -open [16] if  $A$  is the union of regular open sets and  $\pi$ -closed if  $A$  is the intersection of regular closed sets.

The alpha-closure of a subset  $A$  of  $X$  is the intersection of all alpha-closed sets containing  $A$  and is denoted by  $\alpha clA$ .

**Definition 2.2:** A subset  $A$  of a space  $X$  is called

- (i) semi generalized-closed (briefly sg-closed) [3] if  $scIA \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi-open.
- (ii) generalized pre regular-closed (briefly gpr-closed) [4] if  $pclA \subseteq U$  whenever  $A \subseteq U$  and  $U$  is regular-open.
- (iii) generalized b-closed (briefly gb-closed) [1] if  $bclA \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open.
- (iv) semi generalized b-closed (briefly sgb-closed) [6] if  $bclA \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi-open.
- (v) alpha Weakly Semi closed [11] (briefly  $\alpha$ ws-closed) if  $\alpha clA \subseteq U$  whenever  $A \subseteq U$  and  $U$  is ws-open.

The complements of the above mentioned closed sets are their respective open sets. For example a subset  $B$  of a space  $X$  is semi generalized open (briefly sg-open) if  $X - B$  is sg-closed.

**Definition 2.3:** [13] A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called

- i)  $\alpha$ ws-continuous function if  $f^{-1}(V)$  is  $\alpha$ ws-closed in  $(X, \tau)$  for every closed subset  $V$  of  $(Y, \sigma)$ .
- ii)  $\alpha$ ws-irresolute if  $f^{-1}(V)$  is  $\alpha$ ws-closed in  $(X, \tau)$  for every  $\alpha$ ws-closed subset  $V$  of  $(Y, \sigma)$ .

**Definition 2.4:** A topological space  $(X, \tau)$  is said to be

- i) connected if  $X$  cannot be expressed as the union of two disjoint nonempty open sets in  $X$  [15]
- ii) gpr-connected if  $X$  cannot be expressed as the union of two disjoint nonempty gpr-open sets in  $X$  [5]
- iii) gb- connected if  $X$  cannot be expressed as the union of two disjoint nonempty gb-open sets in  $X$  [2]
- iv) sgb-connected if  $X$  cannot be expressed as the union of two disjoint nonempty sgb-open sets in  $X$  [7]
- v) sg- connected if  $X$  cannot be expressed as the union of two disjoint nonempty sg-open sets in  $X$  [8]

**Definition 2.5:** [14] A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called contra  $\alpha$ ws-continuous function if  $f^{-1}(V)$  is  $\alpha$ ws-closed in  $(X, \tau)$  for every open subset  $V$  of  $(Y, \sigma)$ .

**Lemma 2.6:[13]**

Let us assume  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function. Then the following three statements are equivalent.

- i)  $f$  is an  $\alpha$ ws-continuous function.
- ii) The inverse image of each open sets in  $(Y, \sigma)$  is an  $\alpha$ ws-open set in  $(X, \tau)$ .
- iii) The inverse image of each closed sets in  $(Y, \sigma)$  is an  $\alpha$ ws-closed set in  $(X, \tau)$ .

**Remark 2.7:[13]**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called  $\alpha$ ws-irresolute function iff the inverse image of every  $\alpha$ ws-open set in  $(Y, \sigma)$  is  $\alpha$ ws-open in  $(X, \tau)$ .

**3.  $\alpha$ ws-connected Space**

A topological space  $X$  is said to be an  $\alpha$ ws-connected space if  $X$  cannot be expressed as the union of two disjoint nonempty  $\alpha$ ws-open sets in  $X$ .

Otherwise, it's  $\alpha$ ws-disconnected space.

**Theorem 3.1:**

For a topological space  $X$ , the following are equivalent

- i)  $X$  is  $\alpha$ ws-connected.
- ii)  $X$  and  $\phi$  are only subsets of  $X$  which are both  $\alpha$ ws-open and  $\alpha$ ws-closed.
- iii) Each  $\alpha$ ws-continuous map of  $X$  into a discrete space  $Y$  with at least two points is constant map.

**Proof:** **i)  $\Rightarrow$  ii)** Suppose  $X$  is an  $\alpha$ ws-connected space. Let  $S$  be a proper subset which is both  $\alpha$ ws-open and  $\alpha$ ws-closed in  $X$ . Its complement  $X - S$  is also  $\alpha$ ws-open and  $\alpha$ ws-closed. Then  $X = S \cup (X - S)$ , the disjoint union of two non-empty  $\alpha$ ws-open sets, which is a contradiction to our assumption. Therefore  $S = \phi$  or  $X$ .

**ii)  $\Rightarrow$  i)**

Suppose that  $X = A \cup B$  where  $A$  and  $B$  are disjoint nonempty  $\alpha$ ws-open subsets of  $X$ . Then  $A$  and  $B$  are both  $\alpha$ ws-open and  $\alpha$ ws-closed, because  $A = X - B$  and  $B = X - A$ . By our assumption  $A = \phi$  or  $X$  which is a contradiction. Therefore  $X$  is  $\alpha$ ws- connected.

**ii)  $\Rightarrow$  iii)**

Let  $f: X \rightarrow Y$  be an  $\alpha$ ws-continuous function where  $Y$  is a discrete space with at least two points. To prove  $f$  is a constant map. Since  $f$  is an  $\alpha$ ws-continuous function,  $f^{-1}(\{y\})$  is  $\alpha$ ws-closed and  $\alpha$ ws-open for each  $y \in Y$ . By our assumption,  $f^{-1}(\{y\}) = \phi$  or  $X$ . If  $f^{-1}(\{y\}) = \phi$  for all  $y \in Y$ , then  $f$  fails to be a function  $\Rightarrow f^{-1}(\{y\}) = X$  for some  $y \in Y$ . Therefore  $f(x) = y$  for all  $x \in X$ . This shows that  $f$  is a constant map.

iii)  $\Rightarrow$  ii)

Let  $S$  be both  $\alpha$ ws-open and  $\alpha$ ws-closed in  $X$ . Let  $S \neq \phi$ . To prove that  $S = X$ . Let  $f : X \rightarrow Y$  be an  $\alpha$ ws-continuous function by  $f(S) = \{y_1\}$  and  $f(X - S) = \{y_2\}$  for some distinct points  $y_1$  and  $y_2 \in Y$ . By (iii)  $f$  is a constant function. Therefore  $S = X$ .

**Theorem 3.2:**

Every  $\alpha$ ws-connected space is connected.

**Proof:**

Let  $X$  be an  $\alpha$ ws-connected space. Suppose  $X$  is not connected. Then there exists a proper nonempty subset  $B$  of  $X$  which is both open and closed in  $X$ . Since every closed set is  $\alpha$ ws-closed set,  $B$  is a proper nonempty subset of  $X$  which is both  $\alpha$ ws-open and  $\alpha$ ws-closed in  $X$ . Then by using Theorem 3.1,  $X$  is not  $\alpha$ ws-Connected.

The converse of the above theorem is not true as seen in the following Example.

**Example 3.3:**

Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$ . Then  $(X, \tau)$  is connected but not  $\alpha$ ws-connected because  $\{a, c\}$  and  $\{b\}$  are both  $\alpha$ ws-open and  $\alpha$ ws-closed in  $(X, \tau)$ .

**Theorem 3.4:**

If  $f: X \rightarrow Y$  is an  $\alpha$ ws-continuous and  $X$  is an  $\alpha$ ws-connected, then  $Y$  is connected.

**Proof:**

Given  $f$  is an  $\alpha$ ws-continuous and  $X$  is  $\alpha$ ws-connected. To prove that  $Y$  is connected. Suppose  $Y$  is disconnected. Then  $Y = A \cup B$ , where  $A$  and  $B$  are disjoint non-empty open subsets of  $Y$ . Since  $f$  is an  $\alpha$ ws-continuous, by using Lemma 2. 6,  $X = f^{-1}(A) \cup f^{-1}(B)$  where  $f^{-1}(A), f^{-1}(B)$  are disjoint non-empty  $\alpha$ ws-open subsets of  $X$ . This is a contradiction to our assumption. Therefore  $Y$  is connected.

**Theorem 3.5:**

If  $f: X \rightarrow Y$  is an  $\alpha$ ws-irresolute and  $X$  is an  $\alpha$ ws-Connected, then  $Y$  is an  $\alpha$ ws-connected.

**Proof:**

Given  $f$  is an  $\alpha$ ws-irresolute and  $X$  is an  $\alpha$ ws-connected. To prove that  $Y$  is  $\alpha$ ws-connected. Suppose  $Y$  is not  $\alpha$ ws-connected. Then  $Y = A \cup B$ , where  $A$  and  $B$  are disjoint non-empty  $\alpha$ ws-open subsets of  $Y$ . since  $f$  is an  $\alpha$ ws-irresolute, by using Remark 2.7,  $X = f^{-1}(A) \cup f^{-1}(B)$  where  $f^{-1}(A), f^{-1}(B)$  are disjoint non-empty  $\alpha$ ws-open subsets of  $X$ . This is a contradiction to our assumption. Therefore  $Y$  is  $\alpha$ ws-connected.

**Theorem 3. 6:**

The contra  $\alpha$ ws-continuous image of an  $\alpha$ ws-connected space is connected.

**Proof:**

Let  $f : X \rightarrow Y$  be contra  $\alpha$ ws-continuous function from an  $\alpha$ ws-connected space  $X$  onto a topological space  $Y$ . Assume  $Y$  is disconnected. Then  $Y = A \cup B$ , where  $A$  and  $B$  are non-empty clopen subsets of  $Y$  with  $A \cap B = \phi$ . since  $f$  is contra  $\alpha$ ws-continuous, we have  $f^{-1}(A), f^{-1}(B)$  are non-empty  $\alpha$ ws-open sets in  $X$  with  $f^{-1}(A) \cup f^{-1}(B) = f^{-1}(A \cup B) = f^{-1}(Y) = X$  and  $f^{-1}(A) \cap f^{-1}(B) = f^{-1}(A \cap B) = f^{-1}(\phi) = \phi$ . This means that  $X$  is not  $\alpha$ ws-connected. This is a contradiction to our assumption. Therefore  $Y$  is Connected.

**Theorem 3.7:**

- i) Every gpr-connected space is  $\alpha$ ws-connected.
- ii) Every gb-connected space is  $\alpha$ ws-connected.
- iii) Every sgb-connected space is  $\alpha$ ws-connected.
- iv) Every sg-connected space is  $\alpha$ ws-connected.

**Proof:**

i) Let  $X$  be gpr-connected space. To prove  $X$  is  $\alpha$ ws-connected. Suppose  $X$  is not  $\alpha$ ws-connected. Then there exist disjoint non-empty  $\alpha$ ws-open sets  $A$  and  $B$  such that  $X = A \cup B$ . Since every  $\alpha$ ws-open set is gpr-open set [12],  $A$  and  $B$  are gpr-open sets. This is a contradiction to  $X$  is gpr-connected. Therefore  $X$  is  $\alpha$ ws-connected.

ii) Let  $X$  be gb-connected space. To prove  $X$  is  $\alpha$ ws-connected. Suppose  $X$  is not  $\alpha$ ws-connected. Then there exist disjoint non-empty  $\alpha$ ws-open sets  $A$  and  $B$  such that  $X = A \cup B$ . Since every  $\alpha$ ws-open set is gb-open set [12],  $A$  and  $B$  are gb-open sets. This is a contradiction to  $X$  is gb-connected. Therefore  $X$  is  $\alpha$ ws-connected.

iii) Let  $X$  be sgb-connected space. To prove  $X$  is  $\alpha$ ws-connected. Suppose  $X$  is not  $\alpha$ ws-connected. Then there exist disjoint non-empty  $\alpha$ ws-open sets  $A$  and  $B$  such that  $X = A \cup B$ . Since every  $\alpha$ ws-open set is sgb-open set [12],  $A$  and  $B$  are sgb-open sets. This is a contradiction to  $X$  is sgb-connected. Therefore  $X$  is  $\alpha$ ws-connected.

iv) Let  $X$  be sg-connected space. To prove  $X$  is  $\alpha$ ws-connected. Suppose  $X$  is not  $\alpha$ ws-connected. Then there exist disjoint non-empty  $\alpha$ ws-open sets  $A$  and  $B$  such that  $X = A \cup B$ . Since every  $\alpha$ ws-open set is sg-open set [12],  $A$  and  $B$  are sg-open sets. This is a contradiction to  $X$  is sg-connected. Therefore  $X$  is  $\alpha$ ws-connected.

The converse of the above theorem is need not be true as in the following example

**Example 3.8:**

Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, \{b\}, X\}$ . Then  $(X, \tau)$  is  $\alpha$ ws-connected but not gpr-connected, not gb-connected because  $\{a, b\}$  is both gpr-open and gpr-closed also both gb-closed and gb-open in  $(X, \tau)$ .

**Example 3.9:**

Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . Then  $(X, \tau)$  is  $\alpha$ ws-connected but not sgb-connected, not sg-connected because  $\{a, c\}$  is both sgb-open and sgb-closed also both sg-closed and sg-open in  $(X, \tau)$ .

**Definition 3.10:**

A topological Space  $X$  is said to be  $T_{\alpha\text{ws}}$ -space if every  $\alpha$ ws-closed Subsets of  $X$  is closed subsets of  $X$ .

**Theorem 3.11:**

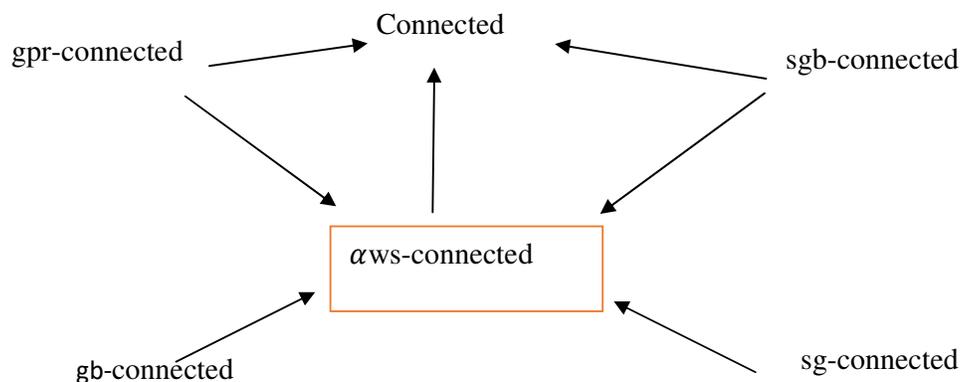

Suppose that  $X$  is  $T_{\alpha\text{ws}}$ -space then  $X$  is connected iff it is  $\alpha$ ws-connected.

**Proof:**

Suppose  $X$  is connected. Then  $X$  is cannot be expressed as disjoint union of two non-empty proper subsets of  $X$ . Suppose  $X$  is not  $\alpha$ ws-connected. Let  $A$  and  $B$  be any two  $\alpha$ ws-open subsets of  $X$  such that  $X = A \cup B$ , where  $A \cap B = \phi$  and  $A \subset X, B \subset X$ . Since  $X$  is  $T_{\alpha\text{ws}}$ -space and  $A, B$  are  $\alpha$ ws-open,  $A$  and  $B$  are open subsets of  $X$ . This is a contradiction to  $X$  is connected. Therefore  $X$  is  $\alpha$ ws-connected. Conversely, Assume  $X$  is  $\alpha$ ws-connected. To prove  $X$  is connected. Suppose  $X$  is not connected. Let  $A$  and  $B$  be any two open subsets of  $X$  such that  $X = A \cup B$ , where  $A \cap B = \phi$  and  $A \subset X, B \subset X$ . since every open set is  $\alpha$ ws-open,  $A$  and  $B$  are  $\alpha$ ws-open subsets of  $X$  such that  $X = A \cup B$ . This is a contradiction to  $X$  is  $\alpha$ ws-connected. Therefore  $X$  is connected.

**Diagram 3.12:**

Relation between  $\alpha$ ws-connected space and some generalized connected space.

**Conclusion:**

In this chapter we have introduced  $\alpha$ ws-connected space and studied some properties.
